    TransformerFactory tf = TransformerFactory.newInstance();
    Transformer transformer = tf.newTransformer();
    DOMSource source = new DOMSource(doc);
    StreamResult result = new StreamResult(xmlFile);

    transformer.transform(source, result);

} catch (Exception e) {
    e.printStackTrace();
}

// Display values
response.setContentType("text/html");
PrintWriter out = response.getWriter();
```

```
        out.println("<h2>User Details</h2>");
        out.println("Username: " + username + "<br>");
        out.println("Email: " + email + "<br>");
    }
}
```

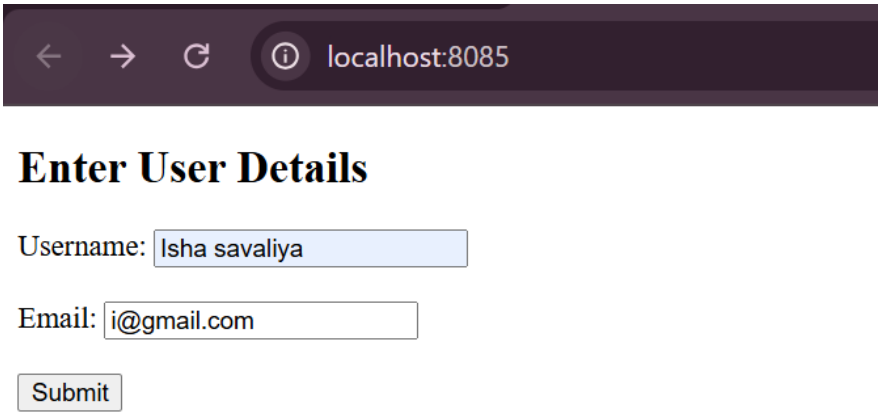
webapp/WEB-INF/web.xml:

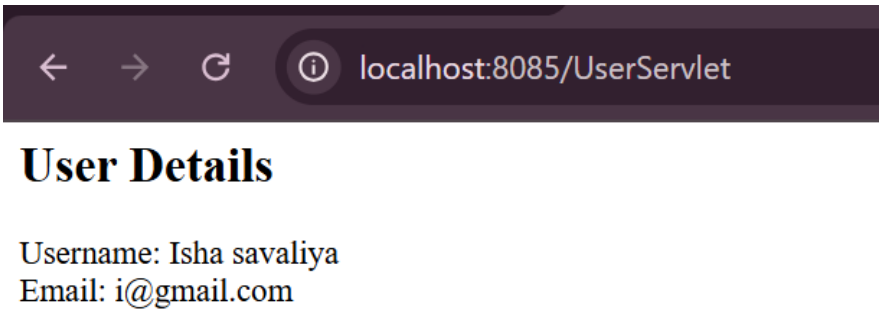
```
<?xml version="1.0" encoding="UTF-8" ?>
<web-app>

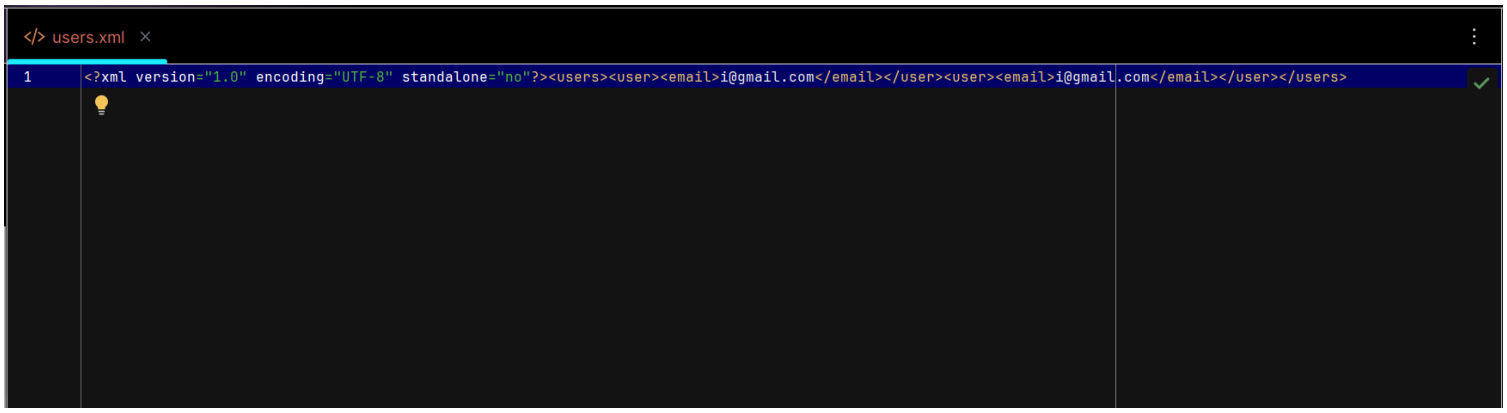
    <servlet>
        <servlet-name>UserServlet</servlet-name>
        <servlet-class>semester6.UserServlet</servlet-class>
    </servlet>

    <servlet-mapping>
        <servlet-name>UserServlet</servlet-name>
        <url-pattern>/UserServlet</url-pattern>
    </servlet-mapping>

</web-app>
```







Conclusion:-

In this practical, successfully developed a web-based application using HTML and Servlet. The application takes user input such as username and email through an HTML form. The email ID is stored in an XML file using DOM parsing techniques, and both the username and email are displayed using a servlet. This practical helped in understanding form handling, servlet processing, and XML file manipulation in Java web applications.
